

Two label versions define distinct validation estimands

Label provenance, validation distance, and training support must be reported together

525-record author-resolved working label set

Internal author-led re-review and resolution
Rubber: 16 records
q25 separation: approximately 158.5 km
One fold has no rubber training records

Estimand available

Label-source and internal re-review sensitivity
Complete four-fold q25 performance: not estimable

622-record original-label sensitivity benchmark

Historical original labels retained for sensitivity analysis
q25 separation: approximately 126.8 km
All four folds evaluable, but training support is uneven
Not independently verified ground truth

Estimand available

Complete-fold q25 sensitivity performance
Conditional on original labels and current training support

Common reporting rule

Hold the B0-B3 feature/model definitions fixed; report the label version, q25 distance, per-fold training support, unweighted fold mean, and pooled out-of-fold performance.

The two branches answer different questions; neither should be presented as a universal map-accuracy estimate.
